Axisymmetric Gasket Analysis The Axisymmetric Method focused on single areas of the mul-tilayered gasket during the cold clamping case. The main purpose of this procedure is to determine the gasket de action and stresses at certain cross sections of the gasket assembly, without having to complete a full 3D analysis. Any axisymmetric FEA analysis as-

For a gasket behavior that is not readily addressed by these special behavior models, such as occurs when coupled behaviors or through-thickness tensile behavior must be considered, ABAQUS/Standard provides a versatile alternative by allowing a gasket element to use either a built-in or user-defined material model (see “Defining the gasket behavior using a material model,” Section 18.6.5, for

details).

Therefore, Abaqus/Standard offers a variety of gasket elements that have through-
thickness behaviors specifically designed for the study of gaskets. The gasket
behavior models are separate from the models in the material library and assume
that the thickness-direction, transverse shear, and membrane behaviors are

uncoupled (see Defining the gasket behavior directly using a gasket behavior model for details).

Cylinder Head Gasket Simulation in Finite Element Analysis

The inter-layer spaces in a gasket are referred to in Abaqus as the initial void. The initial void is used only for calculating thermal strain and creep strain. It is also possible that the gasket surface geometry is such that pressure will not start building up until the gasket has been compressed by a certain amount.

FINITE ELEMENT ANALYSIS OF HEAD GASKET

Abaqus Python Scripting Gaskets, which are essentially Press in place (PIP), are widely used in automotive industry to seal various joints. These gaskets are made from elastomeric (Hyper elastic) materials. Sealing performance of these gaskets can be predicted by performing a 2D gasket cross section analysis in Abaqus. The new method is based on a feature of the ABAQUS® finite element solver which allows the user complete freedom to define unique material properties. This is an attractive option for cylinder head gasket analysis because the user has the freedom to describe materials which are non-linear and anisotropic.
